KEEL

The signal moves. The stream holds.

Keel is cloud streaming infrastructure for IRL streamers. A keel is the fixed line under a boat that keeps it upright while everything above it is moving. Your phone, your network and your route will wobble. The broadcast should not.

1 HOLD

A dropped signal never kills the broadcast. Viewers get a designed BRB, not a dead stream.

2 SHOW

The streamer sees signal state and a reliability record, not a wall of settings.

3 PROVE

Drops held, longest drop, unexpected stops. Reliability is measured and shown.

IDENTITY

Wide, heavy, level.

KEEL

KEEL

The wordmark's L foot extends into a level line: the horizon the stream holds.
